

February will be a fun month in Science Class! We will be learning about Magnets and Magnifiers (magnifying glasses). We will begin by talking about what a magnet is attracted to and how they can be used to move things. The 4 year olds will make a magnet to take home so that they can be Magnet Scientists at home, as well as at school! The end of the month will focus on magnifying glasses. How do they work? How do they help us see things better? What kinds of things can I see using a magnifying glass? Ask your child about his/her experiences in Science! The more they talk about the concepts, the more they will retain and understand!
